Sub Type: veg_comp_poly

Attribute Name: alpine_designation

Alias: alpine designation

Forestry Term: Alpine Designation

Description: The location of the land unit with respect to location and elevation. An interpretation is applied as to whether the tree unit is above or below the tree line, that is, the upper elevation limit of continuous tree, or potential tree if cut-over, cover. If the land unit is above the the elevation line, a code of 'A' is applied, otherwise 'N', the default.

Measurement Criteria: An interpretation is applied as to whether the tree unit is above or below the tree line.

Standard: If the land unit is above the elevation line, a code of 'A' is applied, otherwise 'N', the default.

Default:

Permitted Values: Codes Description

A Alpine
Alpine is the land area above the maximum elevation for tree species, dominated in vegetated areas by shrubs, herbs, bryoids and lichens. Much of the Alpine is non-vegetated covered primarily by rock, ice and snow. The Alpine is treeless by definition, however, there may be a few rare trees (<1% crown closure).

N Not Alpine
Areas not included in Alpine areas, as defined above.

Input Format: X

Input Example: N

Data Origin: input

Attribute Source: vri

Sequence:	33
Optional:	Y
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes: Alpine designation contributes to the framework for delineation of ecosystems and habitat and the third level of reporting ability.

Tips and Hints:

Sub Type: veg_comp_poly

Attribute Name: bclcs_level_1

Alias: bclcs level 1

Forestry Term: British Columbia Land Cover Classification Scheme Level 1

Description: The first level of the BC land cover classification scheme classifies the presence or absence of vegetation within the boundaries of the polygon. Presence or absence is recognized by the vertical projection of vegetation upon the land base within the polygon .

Measurement Criteria: Presence or absence is recognized by the vertical projection of vegetation upon the land base within the pol

Standard: Level 1 is derived from the sum of the vegetation crown closures

Default:

Permitted Values:

V = Vegetated
A polygon is considered Vegetated when the total cover of trees, shrubs, herbs, and bryoids (other than crustose lichens) covers at least 5% of the total surface area of the polygon.

N = Non-Vegetated
A polygon is considered Non-Vegetated when the total cover of trees, shrubs, herbs, and bryoids (other than crustose lichens) covers less than 5% of the total surface area of the polygon. Bodies of water are to be classified as Non-Vegetated.

U = Unreported
A polygon is classified as Unreported if it is within the mapsheet being reported on, but is outside the inventory unit of interest. The Unreported designation is restricted to areas where inventory information is not currently available.

Examples include National Parks, Provincial Parks (where information is not available), Tree Farm Licences and Tree Farms that are not in the existing vegetation cover databases, and areas outside of the Province of British Columbia.

Note: Bodies of water may have vegetation on or under their surface; they are the responsibility of others to evaluate.

Sub Type: veg_comp_poly

Attribute Name: bclcs_level_2

Alias: bclcs level 2

Forestry Term: British Columbia Land Cover Classification Scheme Level 2

Description: The second level of the BC land cover classification scheme classifies the polygon as to the land cover type: treed or non-treed for vegetated polygons; land or water for non-vegetated polygons.

Measurement Criteria: For vegetated polygons, Aan interpretation is made of the coverage of tree crowns as measured by their

Standard: Level 2 is derived from the tree crown closure estimatem for vegetated polygons and the non-vegetated cover percent estimate for non-vegetated polygons.

Default:

Permitted Values:

T = Treed
A polygon is considered Treed if at least 10% of the polygon area, by crown cover, consists of tree species of any size.

N = Non-treed
A polygon is considered Non-Treed if less than 10% of the polygon area, by crown cover, consists of tree species of any size.

L = Land
The portion of the landscape not covered by water (as defined below), based on the percentage area coverage.

W = Water
A naturally occurring, static body of water, two or more metres deep in some portion, or a watercourse formed when water flows between continuous, definable banks. These flows may be intermittent or perennial; but do not include ephemeral flows where a channel with no definable banks is present. Islands within streams that have definable banks are not part of the stream; gravel bars are part of the stream. Interpretation is based on the percentage area coverage.

Sub Type: veg_comp_poly

Attribute Name: bclcs_level_3

Alias: bclcs level 3

Forestry Term: British Columbia Land Cover Classification Scheme Level 3

Description: The location of the polygon relative to elevation and drainage, and is described as either alpine, wetland or upland. In rare cases, the polygon may be alpine wetland.

Measurement Criteria: The polygon classification is determined by the landscape position with the majority coverage by area.

Standard: The Alpine designation indicates polygons that fall in the alpine regions of the landscape. For all other polygons, land cover component #1 soil moisture regime will determine whether that polygon is considered to be Upland or Wetland.

Default:

Permitted Values:

W = Wetland
Land having the water table near, at, or above the soil surface, or which is saturated for a long enough period to promote wetland or aquatic processes as indicated by poorly drained soils, specialized vegetation, and various kinds of biological activity which are adapted to the wet environment.

In the Canadian wetland classification, wetland classes include bogs, fens, marshes, swamps, hot springs, hot pools, and shallow water. In British Columbia, Wetlands include forested or non-forested subhydric (SMR 7) sites, in addition to non-forested hydric (SMR 8) ecosystems (see the B.C. Land Cover Classification document for a detailed description).

U = Upland
A broad class that includes all non-wetland ecosystems below Alpine that range from very xeric, moss- and lichen-covered rock outcrops to highly productive forest ecosystems on hygric (SMR 6) soils.

A = Alpine
Treeless by definition (for practical purposes, 1% tree cover or less can be included within the alpine area) with vegetation dominated by shrubs, herbs, graminoids, bryoids, and lichens. Much of the Alpine is non-vegetated, covered primarily by rock, ice, and snow.

Notes: The BC Land Cover Classification Scheme can be used to facilitate broad land classification reporting.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual an

Sub Type: veg_comp_poly

Attribute Name: bclcs_level_4

Alias: bclcs level 4

Forestry Term: British Columbia Land Cover Classification Scheme Level 4

Description: Classifies the vegetation types and non-vegetated cover types (as described by the presence of distinct features upon the land base within the polygon).

Measurement Criteria: For vegetated polygons, Aan interpretation is made of the coverage of vegetation crown closure as

Standard: If the polygon is Treed, the basal area of each species (expressed as percent composition) is reviewed and amalgamated to determine which vegetation type the polygon should be classified as. For vegetated, non-treed polygons, a hierarchical system incorporating the crown cover of shrubs, herbs and bryoids determines the Level 4 classification for the polygon.

Default:

Permitted Values:

TC = Treed - Coniferous
Defined as those trees found in B.C. within the order Coniferae. These trees are commonly referred to as conifer or softwoods. The polygon is classified as Coniferous when the total basal area (expressed as percentage species composition), of coniferous trees is 75% or more of the total polygon tree basal area, and trees cover 10% or more of the total polygon area, by crown cover.

TB = Treed - Broadleaf
Defined as those trees classified botanically as Angiospermae in the subclass Dicotyledoneae. These species are commonly referred to as deciduous or hardwoods. The polygon is classified as Broadleaf when the total basal area (expressed as percentage species composition) of broadleaf trees is 75% or more of the total polygon tree basal area, and trees cover a minimum of 10% of the total polygon area, by crown cover.

TM = Treed - Mixed
The polygon is classified as Mixed when neither coniferous nor broadleaf trees account for 75% or more of the total polygon tree basal area, and trees cover a minimum of 10% of the total polygon area, by crown cover.

ST = Shrub Tall
A shrub polygon with average shrub height greater than or equal to two metres.

SL = Shrub Low
A shrub polygon with average shrub height less than two metres.

HE = Herb
An herb polygon with no distinction between forbs and graminoids.

HF = Herb - Forbs
An herb polygon with forbs greater than 50% of the herb cover

HG = Herb - Graminoids
An herb polygon with graminoids greater than 50% of the herb cover.

BY = Bryoid
A bryoid polygon with no distinction between mosses and lichens.

BM = Bryoid - Moss
A bryoid polygon with mosses, liverworts and hornworts greater than 50% of the bryoid cover.

BL = Bryoid - Lichens
A bryoid polygon with lichens (foliose or fruticose; not crustose) greater than 50% of the bryoid cover.

SI = Snow / Ice

Defined as either glacier, which is considered a mass of perennial snow and ice with definite lateral limits, typically flowing in a particular direction; or other ice and snow cover that is not part of a glacier.

RO = Rock / Rubble
Defined as bedrock or fragmented rock broken away from bedrock surfaces and moved into its present

position by gravity or ice. Extensive deposits are found in and adjacent to alpine areas and are associated with steep rock walls and exposed ridges; canyons and cliff areas also contain these deposits.

EL = Exposed Land
Contains all other forms of exposed land identified by a range of subclasses.

Input Format:	XX	Sequence:	39

Sub Type: veg_comp_poly

Attribute Name: bclcs_level_5

Alias: bclcs level 5

Forestry Term: British Columbia Land Cover Classification Scheme Level 5

Description: Classifies the vegetation density classes and Non-Vegetated categories.

Measurement Criteria:

Standard: For vegetated polygons, the Vegetation Types from Level 4 of the Scheme are further classified into density classes as listed below. Note that these are reporting breaks only and interpreters estimate density as a continuous variable. For non-vegetated polygons, the Non-Vegetated Cover Types from Level 4 of the Scheme are further classified into categories as listed below. Note that the Water cover type from Level 2 of the Scheme does not contain any classes or descriptions for water features in Level 4 of the Scheme.

Default:

Permitted Values:

DE = Dense
Tree, shrub, or herb cover is between 61% and 100% for the polygon.

OP = Open
Tree, shrub, or herb cover is between 26% and 60% for the polygon.

SP = Sparse
Cover is between 10% and 25% for treed polygons, or cover is between 20% and 25% for shrub or herb polygons.

The density classes for Bryoids is as follows:

CL = Closed
Cover of bryoids is greater than 50% of the polygon.

OP = Open
Cover of bryoids is less than or equal to 50% of the polygon.

GL = Glacier
A mass of perennial snow and ice with definite lateral limits, typically flowing in a particular direction.

PN = Snow Cover
Snow or ice that is not part of a glacier but is found during summer months on the landscape.

BR = Bedrock
Unfragmented, consolidated rock, contiguous with the underlying material.

TA = Talus
Rock fragments of any size accumulated on or at the foot of slopes as a result of successive rock falls. This is a type of colluvium.

BI = Blockfield
Blocks of rock derived from the underlying bedrock by weathering and / or frost heaving. These have not undergone any significant down slope movement as they occur on level or gently sloping areas.

MZ = Rubbly Mine Spoils
Discarded overburden or waste rock, moved to extract ore during mining.

LB = Lava Bed
An area where molten rock has flowed from a volcano or fissure and cooled and solidified to form rock.

RS = River Sediments
Silt, gravel, and sand bars associated with former river channels and present river edges.

ES = Exposed Soil
Any exposed soil not covered by the other categories, such as areas of recent disturbance that include mud slides, debris torrents, avalanches, or disturbances such as pipeline rights-of-way or cultivated fields where vegetation cover is less than 5%.

LS = Pond or Lake Sediments
Exposed sediments related to dried lakes or ponds.

RM = Reservoir Margin
Land exposed by a drained or fluctuating reservoir. It is found above "normal" water levels and may consist of a range of substrates including gravel, cobbles, fine sediments, or bedrock.

BE = Beach
An area with sorted sediments reworked in recent time by wave action, which may be formed at the edge of fresh or salt water bodies.

LL = Landing
A compacted area adjacent to a road used for sorting and loading logs.

BU = Burned Area
Land showing evidence of recent burning, either natural or prescribed. Vegetation of less than 5% crown cover is present at the time of polygon description.

RZ = Road Surface
An area cleared and compacted for transporting goods and services by vehicles. Older roads that are used infrequently or not at all may cease to be classed as Non-Vegetated.

MU = Mudflat
Flat plane-like areas associated with lakes, ponds, rivers, or streams — dominated by fine-textured sediments. They can be associated with freshwater or estuarine sources.

CB = Cutbank
Part of a road corridor created upslope of the road surface, created by excavation into the hillside.

MN = Moraine
An area of debris transported and deposited by a glacier.

GP = Gravel Pit
An area exposed through the removal of sand and gravel.

TZ = Tailings
An area containing the solid waste material produced in the mining and milling of ore.

RN = Railway Surface
A roadbed with fixed rails, which may contain single or multiple rail lines.

UR = Urban
Buildings and associated developments such as roads and parking areas which form an almost continuous covering of the landscape.

AP = Airport
A permanent, paved or gravel area, and associated buildings and parking, used by airplanes.

MI = Open Pit Mine
An exposed area used to extract ore during a mining operation. This may contain associated buildings and any tailing produced by the mining and milling process.

OT = Other
A Non-Vegetated polygon where none of the above categories can be reliably chosen.

LA = Lake
A naturally occurring static body of water more than two metres deep in some portion. The boundary for the lake is the natural high water mark.

RE = Reservoir
An artificial basin affected by impoundment behind a man made structure such as a dam, berm, dyke, or wall.

RI = River/Stream
A water course formed when water flows between continuous, definable banks. Flow may be intermittent or perennial but does not include ephemeral flow where a channel with no definable banks is present. Gravel bars are part of a stream, while islands within a stream that have definable banks are not.

OC = Ocean
A naturally occurring body of water containing salt or generally considered to be salty.

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: coast_interior_cd

Alias: coast interior cd

Forestry Term: Coast Interior Code

Description: A code indicating that the stand is located in the Coast or Interior Region of the Province. The Coast Region is defined as the mainland west of the Cascade and Coast Mountains, including the off-shore islands. Forest Inventory Zones (FIZ) A to C are included in the Coast region. The Interior Region is defined as the mainland east of the Cascade and Coast Mountains. Forest Inventory Zones (FIZ) D to L are included in the Interior Region.

Measurement Criteria: The Coast or Interior classification is used in determining stand volumes and utilization levels.

Standard: 1 character alpha code designating Coast or Interior

Default: must have value

Permitted Values: I Interior (FIZ D, E, F, G, H, I, J, K and L)

C Coast (FIZ A, B, C)

Input Format: X

Input Example: C

Data Origin: derived

Attribute Source: vri

Sequence:

Sub Type: veg_comp_poly

Attribute Name: compartment

Alias: compartment

Forestry Term: Inventory Compartment

Description: Inventory Compartments are a geographic subdivision of an Inventory Region, usually defining a watershed or part thereof. Inventory Compartment is also part of the reference key for identifying the geographic location of all Inventory Branch samples.

Inventory compartment is also part of the reference key for identifying the geographic location of all Inventory Branches samples. Inventory compartment, along with compartment letter and inventory region form the key to identifying inventory samples

Measurement Criteria:

Standard: A 3 digit numeric code between 1 and 206 with 999 being used for areas outside the province.

Default: 999 designates areas outside of the provinc

Permitted Values: Between 1 and 206 with 999 being used for areas outside the Province.
0 = Salt Water

Input Format: ###

Input Example: 206

Data Origin: derived

Attribute Source: both

Sequence:	
Optional:	
Format:	number
Length:	3
Decimal Places:	
Null:	Y

Use: Used to indicate the area of the polygon that is located within an Inventory Compartment. Used in conjunction with Inventory Region to assign FIZ zones. Also used for defining area boundaries for are and volume summaries.

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes: Inventory Compartment, along with Compartment Letter and Inventory Region form the key to identifying Inventory samples.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: compartment_letter

Alias: compartment letter

Forestry Term: Inventory Compartment Letter

Description: The Compartment Letter(s) that fall within the forest cover polygon. Compartment Letter is a geographic subdivision of an Inventory Compartment. It is also part of the reference key for identifying the geographic location of all Inventory Branch samples.

Measurement Criteria: Compartment Letter only applies to some Inventory Compartments (e.g. only in Inventory Regions 1, 3, 5, 6,

Standard: 1 character alpha code holding compartment letter

Default: blank

Permitted Values: <blank> No compartment Letter
A
B, etc

Input Format: X

Input Example: A

Data Origin: derived

Attribute Source: both

Sequence:	
Optional:	
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use: Used to indicate the area of the polygon that is located within a compartment letter. Used in conjunction with inventory region to assign FIZ zones. Also used for defining area boundaries for area and volume summaries.

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes: Compartment Letter, along with Inventory Compartment and Inventory Region form the key to identifying Inventory samples.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: conf_index_basal_area_cd

Alias: conf index basal area cd

Forestry Term: Confidence Index Basal Area Code

Description: Confidence indices are a subjective value that reflect confidence of the photo interpreter in the estimation of basal area for each layer.

Measurement Criteria:

Standard:

Default:

Permitted Values: 1-9

Input Format: #

Input Example: 2

Data Origin: input

Attribute Source: vri

Sequence:

Optional:

Format: number

Length: 1

Decimal Places:

Null: Y

Use:

Notes: Confidence indices are no longer required as a photo interpreted attribute.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: crown_closure

Alias: crown closure

Forestry Term: Crown Closure

Description: Tree crown closure is the percentage of ground area covered by the vertically projected crowns of the tree cover for each tree layer within the polygon and provides an essential estimate of the vertical projection of tree crowns upon the ground.

Measurement Criteria: Crown closure is estimated for each tree layer in the polygon. Crown closure estimation can be aided by cov

Standard: 3 character numeric value holding crown closure expressed

Default: 0

Permitted Values: 0 to 100

Input Format: ###

Input Example: 45

Data Origin: input

Attribute Source: vri

Sequence:	
Optional:	
Format:	number
Length:	3
Decimal Places:	
Null:	Y

Use: Used as an indirect measure of stand density in Growth Models. Growth models are used to calculate stand volumes and diameters.

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Used in the application of Growth Models to adjust volume based stand density. Also used for the estimation of understory productivity.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: culmination_mai_125

Alias: culimination mai at 12.5 cm

Forestry Term: Culmination Mean Annual Increment at 12.5 cm

Description: The maximum annual increment in stand volume at the 12.5 cm utilization level. Culmination MAI is determined net decay only and only for type id (TYPID) 1, 2, 3, 4, 5 and 9. It is the Increment of tree volume to a given age in years divided by that age for that utilization level

Attribute Name: ecosys_class_data_src_cd

Alias: ecosys class data src cd

Forestry Term: Ecosystem Class Data Source Code

Description: The source of the data used in the interpretation of the ecological attributes (Surface expression, modifying process, site position meso, alpine designation, and soil nutrient regime) that describe the polygon.

Measurement Criteria: The data source will provide an indication of the reliability of attribute descriptions and may be used in the pr

Standard: 2 character numeric code designating method of data

Default:

Permitted Values: Codes Data Sources Possible Applications
0 Photo interpretation

1 Air call (air observation without 70 mm photography) species composition

2 Air call from low-level, fixed base (70 mm photography) species comp., height

3 Phase 1 photo sample (pre-1990)

4 Ground call 1 point age, height

5 Standard fixed radius sample (pre-1979) age, height

6 Phase 2 or phase 3 sample (pre-1990) species, age, height, density, basal area

7 Silviculture surveys - stocking, survival, free growing, pre-stand tending species composition, density, SMR, SNR

8 Ground observation with measurement age, height

9 Research plots (e.g. Sx trials, ecological site description) species, age, height

10 Valuation cruise plot(s) basal area, species composition, height

11 Silviculture treatment record - a record that summarizes the modified stand structure following an activity or treatment such as planting, juvenile spacing, brushing and weeding, conifer release, seed tree control, sanitation spacing, rehabilitation or commercial thinning

12 Disturbance - an area recently disturbed by fire, logging, windthrow, or insects that is classified as NSR. Has no source of information other than type and year of disturbance

13 Managed stand sample

14 Ground call, 2 or more points age, height, species composition

16 Vegetation sample age, height, density, basal area, SMR, SNR

17 Vegetation ground call age, height, density, basal area, SMR, SNR

18 Vegetation air call species composition, shrub height, shrub %

19 Natural growth sample species, age, height

20 Volume and depletion sample age, height

22 Photogrammetrically captured information that is determined or captured using photogrammetric means. An example of this is the determination of photo-measured heights using softcopy technology or parallax bars.

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: for_cover_rank_cd

Alias: for cover rank cd

Forestry Term: Forest Cover Rank Code - Rank or Importance of Layer

Description: A numeric designation of the relative importance of the layer component in the stand as determined by the business. The level of importance decreases as the numeric designation increases. For Vegetation Cover originated data, this value is assigned via business rule based on the supplied order of the layer records as recorded by the interpreter. For FIP originated data, this value is known as the RANK CD, and is explicitly supplied by the interpreter. The RANK CD, or ranking, is based on Regional guidelines at the time of interpretation. This value is retained for FIP transition purposes, as tree volumes are only calculated by VDYP, the current software/mathematical model in production. The RANK CD will be superceded in time when Vegetation Inventory projection tools are developed.

Measurement Criteria: Each layer in a multi-layered stand is assigned a rank code indicating the relative importance of that layer. T

Standard: For Vegetation Cover originated data, this value is assigned via a series of business rules based on the species composition, age, height and crown closure of the layers as recorded by the interpreter.

Default: blank

Permitted Values: 1 Rank 1, most important layer

2 Rank 2, second most important layer

3 Rank 3, third most important layer

Input Format: #

Input Example: 2

Data Origin: input / derived

Attribute Source: fip / vri

Sequence:	8
Optional:	Y
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use: Defines the importance of the layer. Only Rank 1 layers are used when summarizing the land base for Timber Supply Analyses.

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Volumes are calculated for Rank 1 stands only. Rank assignment is based on Regional guidelines.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: full_label

Alias: full label

Forestry Term: Full Label

Description: The full Vegetation Map label. It contains the polygon id, Opening number, species composition, projected age, projected height, site index and crown closure, and indicator of shrub, herb, bryoid, or non vegetative components, and the historic disturbance and forest management activities. It is at most 8 lines. Back slashes represent carriage returns.

Sub Type: veg_comp_poly

Attribute Name: herb_cover_pattern

Alias: herb cover pattern

Forestry Term: Herb Cover Pattern

Description: Herb cover pattern is a code that describes the spatial distribution of the herbaceous species within the polygon. Herb cover pattern is used to describe the herb layer spatial distribution. Examples include clumps of herbaceous species on rock outcrops, scattered patches or individual herbs or solid, continuous herbaceous cover.

Measurement Criteria: Herb cover pattern is used to describe the herb layer spatial distribution.

Standard: Herb cover pattern is based on the majority area coverage.

Default:

Permitted Values: Herb Cover Pattern Code

1. Single to very few (<4) occurrences of limited extent, circular to irregular shape
2. Single to very few (<4) occurrences of limited extent, linear or elongated shape.
3. Several (>3) sporadic occurrences of limited extent, circular to irregular shape.
4. Several (>3) sporadic occurrences of limited extent, linear or elongated shape.
5. Intimately intermixed units, often with gradational transitions from one to the other.
6. Discontinuous but extensive occurrences, parallel to sub-parallel elongated in shape.
7. Limited continuous occurrence with few inclusions.
8. Continuous occurrence with several inclusions.
9. Continuous occurrence with very few inclusions.

Sub Type: veg_comp_poly

Attribute Name: herb_cover_type

Alias: herb cover type

Forestry Term: Herb Cover Type

Description: This set of attributes describes the portion of herb cover that is no obscured by the vertical projection of the crowns of either trees or shrubs. Herbs are defined as non-woody (vascular) plants, including graminoids (sedges, rushes, grasses), forbs (ferns, club mosses, and horsetails) and some low, woody species and intermediate life forms.

Measurement Criteria:

Standard: Measured to the level of resolution that can be photo interpreted for all herbaceous cover types observable in the polygon.

Default:

Permitted Values:

Codes	Description
HE	Herb A Herb polygon with no distinction between forbs and graminoids
HF	Herb - Fords A Herb polygon with forbs greater than 50% of the herb cover.
HG	Herb - Graminoids A Herb polygon with graminoids greater than 50% of the herb cover.

Attribute Name: interpreted_data_src_cd

Alias: interpreted data src cd

Forestry Term: Interpreted Data Source Code

Description: The source of the data that contributed to the determination of the classification description. All values taken from Table 3-1, PIP This list of values is similar, but not identical to the FIP DATA SOURCE which will be used to validate the FIP file prior to loading. Non-conforming FIP DATA SOURCE values will be converted to the VEGETATION DATA SOURCE values on load to the Vegetative Cover database.

Measurement Criteria:

Standard:

Default:

Permitted Values: Codes - Data Sources - Possible Applications
0 - Photo interpretation -

1 - Air call (air observation without 70 mm photography) - species composition

2 - Air call from low - level, fixed base (70 mm photography) - species comp., height

3 - Phase 1 photo sample (pre - 1990) -

4 - Ground call 1 point - age, height

5 - Standard fixed radius sample (pre - 1979) - age, height

6 - Phase 2 or phase 3 sample (pre - 1990) - species, age, height, density, basal area

7 - Silviculture surveys - stocking, survival, free growing, pre - stand tending - species composition, density, SMR, SNR

8 - Ground observation with measurement - age, height

9 - Research plots (e.g. Sx trials, ecological site description) - species, age, height

10 - Valuation cruise plot(s) - basal area, species composition, height

11 - Silviculture treatment record - a record that summarizes the modified stand structure following an activity or treatment such as planting, juvenile spacing, brushing and weeding, conifer release, seed tree control, sanitation spacing, rehabilitation or commercial thinning -

12 - Disturbance - an area recently disturbed by fire, logging, windthrow, or insects that is classified as NSR. Has no source of information other than type and year of disturbance -

13 - Managed stand sample -

14 - Ground call, 2 or more points - age, height, species composition

16 - Vegetation sample - age, height, density, basal area, SMR, SNR

17 - Vegetation ground call - age, height, density, basal area, SMR, SNR

18 - Vegetation air call - species composition, shrub height, shrub %

19 - Natural growth sample - species, age, height

20 - Volume and depletion sample - age, height

22 - Photogrammetrically captured information that is determined or captured using photogrammetric means. An example of this is the determination of photo - measured heights using softcopy technology or parallax bars. - age, height

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: interpreter

Alias: interpreter

Forestry Term: Interpreter

Description: The name of the person who provided the estimates for the data associated with each polygon.

Measurement Criteria:

Standard:

Default:

Permitted Values:

Input Format:	XXXXXXXX
Input Example:	John Smith
Data Origin:	input
Attribute Source:	vri

Sequence:	30
Optional:	Y
Format:	varchar2
Length:	30
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: inventory_region

Alias: inventory region

Forestry Term: Inventory Region

Description: Inventory Regions are an administrative and planning level boundary used to subdivide the Province into 88 units. Inventory Region is also part of the reference key for identifying the geographic location of all Inventory Branch samples.

Measurement Criteria:

Standard: 2 character numeric code between 1 and 88 with 99 benign used for areas outside the Province.

Default: 99

Permitted Values: 0 - Salt Water
1 to 88 - Valid Inventory Regions
99 - Areas outside the Province

Input Format: ##

Input Example: 99

Data Origin: derived

Attribute Source: both

Sequence:	
Optional:	
Format:	number
Length:	2
Decimal Places:	
Null:	Y

Use: Used to indicate the area of the polygon that is located within an Inventory Region. Used in conjunction with Inventory Compartment to assign FIZ zones. Also used for defining area boundaries for area and volume summaries.

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes: Used to indicate the area of the polygon that is located within an Inventory Region. Used in conjunction with Inventory Compartment to assign FIZ zones. Also used for defining area boundaries for area and volume summaries.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: inventory_standard_cd

Alias: inventory standard cd

Forestry Term: Inventory Standard Code

Description: Code indicating under which inventory standard the data was collected. Values are: "V:" for Vegetation Resources Inventory (VRI), "F" for Forest Inventory Planning (FIP) and "I" for Incomplete (when a full set of VRI attributes is not collected).

Measurement Criteria:

Standard:

Default:

Permitted Values: V-full VRI

Input Format:	X
Input Example:	V
Data Origin:	input
Attribute Source:	vri

Sequence:	40
Optional:	Y
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: inventory_type_group_num

Alias: inventory type group num

Forestry Term: Inventory Type Group

Description: The designation of species composition by one of 42 type groups, each being a unique combination of pure or mixed species.

Measurement Criteria: For all Inventory Type Groups (ITGs) any third species is allowed. Pl includes Pa, Pf and Pj for Inventory Ty

Standard: 2 character numeric code indicating inventory type group.

Default: 0

Permitted Values:

ITG CODE	NAME	FIRST SPECIES	SECOND SPECIES	EXAMPLES
1	Fd	Fd >80%	Any	Fd, FdPw, FdPwC1w
2	FdCw	Fd	Cw or Yc	FdCw, FdYc, FdCwH
3	FdH	Fd	H or B	FdH, FdB, FdHCw
4	FdS	Fd	S	FdS, FdSB, FdSH
5	FdPl	Fd	Pl	FdPl, FdPlH, FdPlPy
6	FdPy	Fd	Py	FdPy, FdPyL, FdPyPl
7	FdL	Fd	L, Pw	FdL, FdLPy, FdPwS
8	FdDecid	Fd	Decid	FdDr, FdMb, FdAc
9	Cw	Cw/Yc >80%	Any	Cw, Yc, CwYc, CwPl
10	CwFd	Cw/Yc	Fd, L, Py,	CwFd, CwL, Pw, Pl, YcFd
11	CwH	Cw/Yc	H, B, or S	CwH, CwB, CwS, YcH
12	H	H >80%	Any	H, HPw, HPl, HPlYc
13	HFd	H	Fd, L, Py,	HFd, HL, Pw or Pl HFdCw
14	HCw	H	Cw or Yc	HCw, HYc, HCwYc
15	HB	H	B	HB, HBS, HBCw

32	Py	Py	Any	Py, PyFd, PyL, PyPl
33	LFd	L <=80%	Fd	LFd, LFdPy
34	L	L	Any(Fd when L>80%)	L, LPy, LPl, LPyFd
35	AcConif	Ac	Conif	AcS, AcH
36	AcDecid	Ac	Decid	DrFd, DrCwH
38	DrDecid	Dr	Decid	Dr, DrMb
39	Mb	Mb	Any	Mb, MbDr, MbFd
40	E	E	Any	E, EAt, ES
41	AtConif	At	Conif	AtPl, AtS, AtFd
42	AtDecid	At	Decid	At, AtAc, AtE

Input Format:	##
Input Example:	12
Data Origin:	derived
Attribute Source:	both

Sequence:	
Optional:	
Format:	number
Length:	2
Decimal Places:	
Null:	Y

Use: ITG is used extensively in: area, volume, and other summaries where it is not necessary to summarize data by individual species, and determining the Contributing Land Base and assigning net-downs in Timber Supply Analyses and LRUPs.

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: inventory_type_group_src_cd

Alias: inventory type group src cd

Forestry Term: Inventory Type Group Source Code

Description: The data source of the value of the Inventory Type Group (a grouping of the leading species and their relative composition percent).

Measurement Criteria:

Standard: 2 character numeric code designating method of data.

Default:

Permitted Values:

Input Format:	XX
Input Example:	3
Data Origin:	derived
Attribute Source:	fip

Sequence:	
Optional:	
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: This has been renamed from the FIP attribute, INVENTORY TYPE GROUP ORIGIN. An additional value of 'TBL' has been added on conversion to the Vegetative Cover Database to explicitly represent the occurrence of a blank.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: label_centre_x

Alias: label centre x

Forestry Term: Label Centre X

Description: The x co-ordinate of the suggested centre of the label.

Measurement Criteria:

Standard:

Default:

Permitted Values:

Input Format:

Input Example:

Data Origin:

Attribute Source:

Sequence:	780
Optional:	Y
Format:	number

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory

Sub Type: veg_comp_poly

Attribute Name: line_1_opening_symbol_cd

Alias: line 1 opening symbol cd

Forestry Term: Label Line 1 Opening Symbol Code

Description: The opening symbol code is represented as on of the following characters: 'x', '|', or '~'. If the opening number is null, line 1 is not populated, so there is no opening symbol. If the adjoining NTS map number is in the form "num num num char num / char", it is an NTS number, the corresponding opening symbol is a hexagon with an 'N' in it,, and is represented here by '~'. If the adjoining NTS map number is in the form "num num num char num num num", it is a BCGS number, the corresponding opening symbol is a hexagon with an 'X' in it, and is represented here by '|'. Otherwise the opening symbol is an empty hexagon, and is represented here by 'x'.

Measurement Criteria:

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory

Sub Type: veg_comp_poly

Attribute Name: line_8_planting_history

Alias: line 8 planting history

Forestry Term: Label Line 8 Planting History

Description: The planting (or regeneration) history described as a list of years during which artificial plantings was performed.

Measurement Criteria:

Standard:

Default:

Permitted Values:

Input Format:

Input Example:

Data Origin:

Attribute Source:

Sequence:	720
Optional:	Y
Format:	varchar2
Length:	80
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory

Sub Type: veg_comp_layer

Attribute Name: loss_type_cd

Alias: loss type cd

Forestry Term: Loss Type Code

Description: This field is intended to hold a code indicating the method use to determine the methodology used to determine the volume reductions due to decay. The field is currently not populated in the Oracle data base

Measurement Criteria:

Standard:

Default:

Permitted Values: Either N-Net Volume Adjustment Factor (NVAF) or L-Loss Indicators.

Input Format:	XXX
Input Example:	L
Data Origin:	input
Attribute Source:	vri

Sequence:	
Optional:	
Format:	varchar2
Length:	3
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: tree_species veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: map_id

Alias: map id

Forestry Term: Forest Cover Map Number

Description: Identifies the Vegetation Cover Map corresponding to the VRI file

Measurement Criteria:

Standard: 8 character alpha code holding BCGS map number

Default: must have value

Permitted Values: The identifier in this case is eight long and is made up of:
Position 2-4 MAPSHEET GRID NTS or BCGS. Values are 82, 83, 92, 93, 94, 102, 103, 104, 114.

5 MAPSHEET LETTER BCGS/NTS letter. Values are A - P, and W.

6-8 MAPSHEET SQUARE BCGS Number or NTS Number and letter. BCGS number values are 1-100, and NTS number values are 1-16 with NTS letter values A-H , and W.

9 MAPSHEET QUAD an identifier for 3' x 6' (1:10,000 scale) mapsheets.
e.g.. 082G002 - 6' x 12' minute map sheet

Input Format: XXXXXXXX

Input Example: 093J034

Data Origin: input

Attribute Source: vri

Sequence:

Optional:

Format: varchar2

Length: 7

Decimal Places:

Null: N

Use: Identifies the mapsheet containing the corresponding Forest Cover Map.

Linkage:

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: modifying_process

Alias: modifying process

Forestry Term: Modifying Process

Description: A natural mechanism of weathering, erosion and soil material deposition that result in the modification of surficial materials and landforms. Used for terrain classification, site classification, soil condition and identification of potential hazards such as avalanches, slope instability and flooding.

Measurement Criteria: Only active modifying processes are to be assigned. A process is considered active if there is evidence of c

Standard: The code is recorded for the prevalent modifying process within the polygon on the basis of percent area coverage.

Default:

Permitted Values:

A Avalanching Slopes modified by the rapid downslope movement of snow and ice and by the deposition of rock debris, surficial material and vegetation debris transported by snow avalanches. Sites usually contain avalanche chutes and run out zones but may also be affected by ice falling from glaciers.

B River channelling Erosion and channel formation by the flow of water within clearly defined banks.

F Mass movements Down slope movement of cohesive or non-cohesive surficial material and/or bedrock by creeping, sliding, flowing or falling. This includes rock and debris slides, soil slumps and talus slopes.

N None of these descriptions apply; no modifying processes are observed in the polygon.

U Flooding Areas subject to periodic (possibly seasonal) inundation with subsequent deposition of soil particles. Commonly applied to ephemeral lakes.

V Gully erosion Modification of unconsolidated or consolidated surfaces by processes such as running water and snow avalanching that result in the formation of parallel or sub-parallel long, narrow ravines. Singular gullies are not generally included in this class.

Input Format:	X
Input Example:	F
Data Origin:	input
Attribute Source:	vri

Sequence:	31
Optional:	Y
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes: Used for terrain classification, site classification, soil condition and identification of potential hazards such as avalanches, slope instability and flooding.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: non_forest_descriptor

Alias: non forest descriptor

Forestry Term: Non Forest Descriptor

Description: A classification code indicating that the forest cover type is not currently forested, but is capable of supporting commercial forests.This is a FIP classification based attribute only, and is retained for the purposes of business transition from FIP to Vegetation Inventory

Measurement Criteria: The Non-Forest Descriptor indicates that the forest cover polygon is potentially productive, but is not currentl

Standard: 5 character alpha holding the abbreviation for Non-Forest descriptor.

Default:

Permitted Values: NCBR- Non-commercial brush
NC- Non-Commercial
NSR - Not sufficiently restocked
NTA - No typing available

Input Format: XXXXX

Input Example: NCBR

Data Origin: input

Attribute Source: fip

Sequence:	
Optional:	
Format:	varchar2
Length:	5
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Used to define land that is not currently forested but is capable of supporting commercial forest. It is also used to determine potential areas for silviculture treatment and to determine the net land base for Timber Supply Analyses.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: non_productive_cd

Alias: non productive cd

Forestry Term: Non Productive Code

Description: A unique numeric code that references the classes or type of non-productive areas or land that is incapable of supporting commercial forests. This is a FIP classification based attribute only, and is retained for the purposes of business transition from FIP to Vegetation Inventory. There is no expectation that this attribute would be updated or created under Vegetation Inventory classification practise.

Measurement Criteria:

Standard: 2 Character numeric code designating non-productive type code.

Default:

Permitted Values:
01 ICE - Icefield
02 A - Alpine
03 R - Rock
06 GR - Gravel Pit
07 SAND - Sand
09 CL - Clay Bank
10 AF - Alpine Forest (with species etc.)
11 NPBR - Non-Productive Brush
12 NP - Non-Productive
12 NP - Non-Productive Forest (with species etc.)
13 NPBU - Non-Productive Burn
15 L - Lake
16 TIDE - Tidal Flat
18 G - Gravel Bar
25 RIV - River
26 MUD - Mud Flat
35 S - (for input) Swamp (completed file)
42 C - Clearing
50 U - Roads
54 U - Urban
60 P - Hayfield
62 M - Meadow
63 OR - Open Range
64 NA - Non-Applicable (salt water)

Input Format: ##

Input Example: 03

Data Origin: input

Attribute Source: vri

Sub Type: veg_comp_poly

Attribute Name: non_productive_descriptor_cd

Alias: non productive descriptor cd

Forestry Term: Non Productive Descriptor Code

Description: A unique code that references the classes or type of non-productive areas. This is a FIP classification based attribute only, and is retained for the purposes of business transition from FIP to Vegetation Inventory. There is no expectation that this attribute would be updated or created under Vegetation Inventory classification practise.

Measurement Criteria: Used to provide area summaries and statistics for various classes of non-productive areas.

Standard: 5 character alpha code holding the abbreviation of the non-productive descriptor.

Default:

Permitted Values:
NTA No Typing Available
ICE Icefield
A Alpine
R Rock
GR Gravel Pit
SAND Sand
CL Clay Bank
AF Alpine Forest (with Species etc.)
NPBR Non-Productive Brush
NP Non-Productive
NP Non-Productive Forest (with species etc.)
NPBU Non-Productive Burn
L Lake
TIDE Tidal Flat
G Gravel Bar
RIV River
MUD Mud Flat
S Swamp (muskeg)
C Clearing
U Roads
U Urban
P Hayfield
M Meadow

Sub Type: veg_comp_poly

Attribute Name: polygon_area

Alias: polygon area

Forestry Term: Forest Polygon Area

Description: The area of a polygon; usually derived from geographic information system processing software. The total area, in hectares, of the vegetation cover polygon. The total area should be equal to the sum of the areas for all resultants in that polygon.

Measurement Criteria:

Standard: 10 character numeric value holding polygon area

Default: must have value

Permitted Values:

Input Format: ######.###

Input Example: 207.240 ha

Data Origin:

Attribute Source:

Sequence:	19
Optional:	Y
Format:	number
Length:	10
Decimal Places:	3
Null:	Y

Use: To obtain the size, or area, of a polygon. For example, it is used to determine the total area on the mapsheet that has been classified as a particular forest cover type.

Attribute Name: shrub_cover_pattern

Alias: shrub cover pattern

Forestry Term: Shrub Cover Pattern

Description: Shrub cover pattern is a code that describes the spatial distribution of the shrubs within the polygon. Shrub cover pattern is used to describe the shrub layer spatial distribution. Examples include clumps of shrubs on rocky patches or individual shrubs or solid, continuous shrub cover.

Measurement Criteria: Shrub cover pattern is used to describe the shrub layer spatial distribution.

Standard: Shrub cover pattern is based on the majority area coverage.

Default:

Permitted Values: Shrub Cover Pattern Code

1. Single to very few (<4) occurrences of limited extent, circular to irregular shape.
2. Single to very few (<4) occurrences of limited extent, linear or elongated shape.
3. Several (>3) sporadic occurrences of limited extent, circular to irregular shape.
4. Several (>3) sporadic occurrences of limited extent, linear or elongated shape.
5. Intimately intermixed units, often with gradational transitions from one to the other.
6. Discontinuous but extensive occurrences, parallel to sub-parallel elongated in shape.
7. Limited continuous occurrence with few inclusions.
8. Continuous occurrence with several inclusions.
9. Continuous occurrence with very few inclusions.

Length:	4
Decimal Places:	1
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: The direct site index value may be determined from the dominant and codominant trees. Used extensively in Timber Supply Analyses and Local Resource Use Plans (LRUPs) for determining the Contributing Land Base and assigning net-downs.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: site_position_meso

Alias: site position meso

Forestry Term: Site Position Meso

Description: A code denoting the relative position of the sampling site within a catchment area with the intent to be consistent within the scale of topography affecting surface water flow. The vertical difference is usually between 3 and 300m, and the surface area generally exceeds 0.5 has in size. Also known as slope position or meso site position.

Measurement Criteria: he scale of vertical distance for site position meso is usually between 3 m and 300 m.

Standard: A code is recorded for each polygon for the prevalent site position meso of the polygon on the basis of percent area coverage.

Default:

Permitted Values: Codes Description

C Crest
The generally convex uppermost portion of a hill (meso scale). It is usually convex in all directions and generally has no distinct aspect. The term "crest" may also be applied to a ridge.

U Upper slope
The generally convex, upper portion of the slope of a hill (meso scale) immediately below the crest. It has a convex surface profile with a specific aspect.

M Middle slope
The area of the slope of a hill between the upper and lower slope, where the slope profile is not generally concave or convex. It has a straight or somewhat sigmoid surface profile with a specific aspect.

L Lower slope
The area toward the base of the slope of the hill. It generally has a concave surface profile with a specific aspect.

T Toe
The area differentiated from the lower slope by an abrupt decrease in slope gradient. It is often characterized by seepage.

D Depression
Any area that is concave in all directions. It is generally at the foot of a meso scale hill or in a generally level area.

F Flat (Level)
Any level area not immediately adjacent to a meso scale hill (or toe). The surface profile is generally horizontal with no significant aspect.

Input Format:	X

Changes to Version 4 of B.C. Ministry of Forests Tree Code List

1. Exotic species added to list: a) to provide codes for database purposes (requested by Resources Inventory Branch); and b) to accommodate inventories being conducted near areas of settlement that may encounter escaped or naturalized exotics.

2. Hybrids that cannot be easily distinguished or are of doubtful existence were deleted from list. Operational option is to go to upper level generic code if suspected hybrids without codes are encountered; common hybrids still have codes. Deletions include: Sxe (Picea engelmannii x sitchensis), Sxb (Picea glauca x mariana), Sxx (Picea glauca x engelmannii x sitchensis), and Exw (Betula occidentalis x papyrifera).

3. Dm (Alnus tenuifolia) deleted as it is not known to exceed 10 m in height and is most often multi-stemmed.

Changes to Version 4.1 of B.C. Ministry of Forests Tree Code List

Sn (Picea abies) Norway Spruce was added. Note that some printed copies of version 4.0 had Norway spruce included but our master version required the update hence the minor version upgrade.

Changes to Version 4.2 of B.C. Ministry of Forests Tree Code List

Four exotic species requiring codes for database purposes were added: yellow birch (Ey), white ash (Oh), shagbark hickory (Oi), and white oak (Qw).

Changes to Version 4.3 of B.C. Ministry of Forests Tree Code List

One exotic species requiring a code for database purposes was added: Dahurian larch (Ld).

Changes to Version 4 of B.C. Ministry of Forests Tree Code List

1. Exotic species added to list: a) to provide codes for database purposes (requested by Resources Inventory Branch); and b) to accommodate inventories being conducted near areas of settlement that may encounter escaped or naturalized exotics.

2. Hybrids that cannot be easily distinguished or are of doubtful existence were deleted from list. Operational option is to go to upper level generic code if suspected hybrids without codes are encountered; common hybrids still have codes. Deletions include: Sxe (Picea engelmannii x sitchensis), Sxb (Picea glauca x mariana), Sxx (Picea glauca x engelmannii x sitchensis), and Exw (Betula occidentalis x papyrifera).

3. Dm (Alnus tenuifolia) deleted as it is not known to exceed 10 m in height and is most often multi-stemmed.

Changes to Version 4.1 of B.C. Ministry of Forests Tree Code List

Sn (Picea abies) Norway Spruce was added. Note that some printed copies of version 4.0 had Norway spruce included but our master version required the update hence the minor version upgrade.

Changes to Version 4.2 of B.C. Ministry of Forests Tree Code List

Four exotic species requiring codes for database purposes were added: yellow birch (Ey), white ash (Oh), shagbark hickory (Oi), and white oak (Qw).

Changes to Version 4.3 of B.C. Ministry of Forests Tree Code List

One exotic species requiring a code for database purposes was added: Dahurian larch (Ld).

species_cd_2

Species Composition Code - Second Species

Input Format:	XXX
Input Example:	PL
Data Origin:	input
Attribute Source:	both

Sequence:	
Optional:	
Format:	varchar2
Length:	4
Decimal Places:	
Null:	Y

Use: The species code is used in determining: species composition, stand volumes, stand decay, waste and breakage, net-downs in Timber Supply Analyses, site index, etc.

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: species_cd_3

Alias: species cd 3

Forestry Term: Species Composition Code - Third Species

Description: A code describing the leading commercial species or brush species in the layer. The species with the highest percent composition (e.g. gross volume or, if a very young stand, the relative number of stems per hectare) is identified a the leading commercial species. Species must be above a specified diameter to be recognized in the species composition of the layer. Leading species are described in terms of Genus, Species and Subspecies. There are currently 27 commercial tree species and five genus values recognized in the Province. The code may also used to describe brush species in cases where the Non-Productive Descriptor is NPBR or the Non-Forest Descriptor is NCBR.

Measurement Criteria:

Standard: 3 character alpha code indicating commercial species.

Default: blank

Permitted Values: <blank> No species recorded

Changes to Version 4 of B.C. Ministry of Forests Tree Code List

1. Exotic species added to list: a) to provide codes for database purposes (requested by Resources Inventory Branch); and b) to accommodate inventories being conducted near areas of settlement that may encounter escaped or naturalized exotics.

2. Hybrids that cannot be easily distinguished or are of doubtful existence were deleted from list. Operational option is to go to upper level generic code if suspected hybrids without codes are encountered; common hybrids still have codes. Deletions include: Sxe (Picea engelmannii x sitchensis), Sxb (Picea glauca x mariana), Sxx (Picea glauca x engelmannii x sitchensis), and Exw (Betula occidentalis x papyrifera).

3. Dm (Alnus tenuifolia) deleted as it is not known to exceed 10 m in height and is most often multi-stemmed.

Changes to Version 4.1 of B.C. Ministry of Forests Tree Code List

Sn (Picea abies) Norway Spruce was added. Note that some printed copies of version 4.0 had Norway spruce included but our master version required the update hence the minor version upgrade.

Changes to Version 4.2 of B.C. Ministry of Forests Tree Code List

Four exotic species requiring codes for database purposes were added: yellow birch (Ey), white ash (Oh), shagbark hickory (Oi), and white oak (Qw).

Changes to Version 4.3 of B.C. Ministry of Forests Tree Code List

One exotic species requiring a code for database purposes was added: Dahurian larch (Ld).

species_cd_5

Species Composition Code - Fifth Species

Input Format:	XXX
Input Example:	PL
Data Origin:	input
Attribute Source:	both

Sequence:	
Optional:	
Format:	varchar2
Length:	4
Decimal Places:	
Null:	Y

Use: The species code is used in determining: species composition, stand volumes, stand decay, waste and breakage, net-downs in Timber Supply Analyses, site index, etc.

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: species_cd_6

Alias: species cd 6

Forestry Term: Species Composition Code - Sixth Species

Description: A code describing the leading commercial species or brush species in the layer. The species with the highest percent composition (e.g. gross volume or, if a very young stand, the relative number of stems per hectare) is identified a the leading commercial species. Species must be above a specified diameter to be recognized in the species composition of the layer. Leading species are described in terms of Genus, Species and Subspecies. There are currently 27 commercial tree species and five genus values recognized in the Province. The code may also used to describe brush species in cases where the Non-Productive Descriptor is NPBR or the Non-Forest Descriptor is NCBR.

Measurement Criteria:

Standard: 3 character alpha code indicating commercial species.

Default: blank

Permitted Values: <blank> No species recorded

Changes to Version 4 of B.C. Ministry of Forests Tree Code List

1. Exotic species added to list: a) to provide codes for database purposes (requested by Resources Inventory Branch); and b) to accommodate inventories being conducted near areas of settlement that may encounter escaped or naturalized exotics.

2. Hybrids that cannot be easily distinguished or are of doubtful existence were deleted from list. Operational option is to go to upper level generic code if suspected hybrids without codes are encountered; common hybrids still have codes. Deletions include: Sxe (Picea engelmannii x sitchensis), Sxb (Picea glauca x mariana), Sxx (Picea glauca x engelmannii x sitchensis), and Exw (Betula occidentalis x papyrifera).

3. Dm (Alnus tenuifolia) deleted as it is not known to exceed 10 m in height and is most often multi-stemmed.

Changes to Version 4.1 of B.C. Ministry of Forests Tree Code List

Sn (Picea abies) Norway Spruce was added. Note that some printed copies of version 4.0 had Norway spruce included but our master version required the update hence the minor version upgrade.

Changes to Version 4.2 of B.C. Ministry of Forests Tree Code List

Four exotic species requiring codes for database purposes were added: yellow birch (Ey), white ash (Oh), shagbark hickory (Oi), and white oak (Qw).

Changes to Version 4.3 of B.C. Ministry of Forests Tree Code List

One exotic species requiring a code for database purposes was added: Dahurian larch (Ld).

species_cd_6

Species Composition Code - Sixth Species

Input Format:	XXX
Input Example:	PL
Data Origin:	input
Attribute Source:	both

Sequence:	
Optional:	
Format:	varchar2
Length:	4
Decimal Places:	
Null:	Y

Use: The species code is used in determining: species composition, stand volumes, stand decay, waste and breakage, net-downs in Timber Supply Analyses, site index, etc.

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: species_pct

Alias: species pct

Forestry Term: Species Percentage

Description: Percentage of the layer that he commercial species occupies. For older stands, tree species percentage is based on relative gross volume (i.e. whole stem volume); for younger stands, tree species percentage is based on the number of stems per hectare. Tree species percentage is estimated to the nearest percent for all living trees above a specified diameter

Measurement Criteria: Tree species percentage is estimated to the nearest percent for all living trees above a specified diameter.

Standard: 3 character numeric value holding percent composition

Default: must have value, may be 0 if no species

Permitted Values: 0 to 100

Input Format: ###

Input Example: 60

Data Origin: input

Attribute Source: fip

Sequence:	3
Optional:	Y
Format:	number
Length:	3
Decimal Places:	
Null:	Y

Use: Tree species percentage is used in determining stand volumes, identifying stands with specific species composition (I.e. pure), net-downs in Timber Supply Analyses

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes: Tree Species Percentage is used in: - determining stand volumes, - identifying stands with specific species composition (i.e. pure), - net-downs in Timber Supply Analyses, etc.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: species_pct_1

Alias: species pct 1

Forestry Term: Leading Species Percentage

Description: Percentages of the layer that each tree species occupies. For older stands, tree species percentage is based on relative basal area; for younger stands, tree species percentage is based on the number of stems per hectare. Tree species percentage is estimated to the nearest percent for all living trees above a specified diameter.

Measurement Criteria: Tree species percentage is estimated to the nearest percent for all living trees above a specified diameter.

Standard: 3 character numeric value holding percent composition

Default: must have value, may be 0 if no species

Permitted Values: 0 to 100

Input Format: ###

Input Example: 60

Data Origin: input

Attribute Source: fip

Sequence:	
Optional:	
Format:	number
Length:	3
Decimal Places:	
Null:	Y

Use: Tree species percentage is used in determining stand volumes, identifying stands with specific species composition (I.e. pure), net-downs in Timber Supply Analyses

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: species_pct_2

Alias: species pct 2

Forestry Term: Second Species Percentage

Description: Percentages of the layer that each tree species occupies. For older stands, tree species percentage is based on relative basal area; for younger stands, tree species percentage is based on the number of stems per hectare. Tree species percentage is estimated to the nearest percent for all living trees above a specified diameter.

Measurement Criteria: Tree species percentage is estimated to the nearest percent for all living trees above a specified diameter.

Standard: 2 character numeric value holding percent composition

Default: must have value, may be 0 if no species

Permitted Values: 0 to 50

Input Format: ##

Input Example: 40

Data Origin: input

Attribute Source: fip

Sequence:	
Optional:	
Format:	number
Length:	2
Decimal Places:	
Null:	Y

Use: Tree species percentage is used in determining stand volumes, identifying stands with specific species composition (I.e. pure), net-downs in Timber Supply Analyses

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: stocking_class_cd

Alias: stocking class cd

Forestry Term: Stocking Class Code

Description: A code describing the stocking class of the layer at the reference year. Stocking class is based on leading commercial species, stand age and/or the size (diameter) and number of stems per hectare. It is a FIP base attribute that is semantically overloaded with meaning.
It is being retained in the Vegetative Cover database to facilitate the interim operation of the tree volume derivation routine, VDYP. Stocking Class variously means: immature, mature trees, density and diameter distribution combinations for certain tree species, and harvested with a remaining canopy. It is expected that this attribute will be eliminated once VDYP 6 dependencies are removed.

Measurement Criteria:

Standard: 1 character alpha code indicating stocking class.

Default:

Permitted Values:

R Residual

0 Immature Stands

1 Stocking Class 1

2 Stocking Class 2

3 Stocking Class 3

4 Stocking Class 4

Input Format: # or X

Input Example: 1

Data Origin: derived

Attribute Source: both

Sequence:	
Optional:	
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Used extensively in identifying stands which contribute to the timber supply. Stocking Class 2, 3 and 4 stands are frequently netted-out of the Contributing Land Base.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: stocking_class_src_cd

Alias: stocking class src cd

Forestry Term: Stocking Class Source Code

Description: A code indicating whether the layer's Stocking Class was input (e.g. measured or estimated) or derived. Indicates the reliability of the Stocking Class Code.

Measurement Criteria:

Standard:

Default:

Permitted Values:
T Table derived
I Input
D Derived

Input Format: #

Input Example: T

Data Origin: derived

Attribute Source: both

Sequence:

Optional:

Format: varchar2

Length: 1

Decimal Places:

Null: Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: surface_expression

Alias: surface expression

Forestry Term: Surface Expression

Description: The form of surficial material apparent on the medium scale photography. A simplified attribution is used owing to the likelihood that the trees will mask surficial features.

Measurement Criteria: Assign the appropriate letter code to each polygon.

Standard: In polygons that have multiple components, record the prevalent surface expression of the polygon on the basis of greatest percent area coverage.

Default:

Permitted Values: Codes Description

C Cone
A cone, or segment of a cone, with a relatively smooth slope gradient, greater than 15 degrees (>25%).

D Depression
Circular or irregular area of lower elevation (such as a hollow) than the surrounding terrain; depressions are greater than two metres deep. Examples are kettle holes and karsts depressions

F Fan
A smooth segment of a cone with a slope gradient of up to 15 degrees (25%). Typically applied to fluvial or alluvial fans.

H Hummock(s)
Steep sided hillocks and hollows with slopes of 15 to 35 degrees (25 to 70%) predominant on unconsolidated materials, and slopes of 15 to 90 degrees (25% to vertical) predominant on bedrock. Slopes are non-linear (not parallel) but, generally, chaotic or dissected and rounded or irregular in profile. Local relief is greater than one metre. Differentiated from undulating on the basis of slope angle.

M Rolling
Elongated hillock(s) with slopes dominantly between 3 and 15 degrees (5 to 25%) with local relief greater than one metre. Slopes are an assemblage of parallel or sub-parallel linear forms with subdued relief and may occur in level or sloped meso slope positions.

N None of these descriptions apply as no apparent surface expression features are present.

P Plain
A level or gently sloping unidirectional surface with gradients of up to three degrees (5%). Local surface irregularities generally have a relief of less than one metre.

R Ridge(s)
Elongated or linear, parallel or sub-parallel hillock(s) or ridges with slopes predominantly between 15 and 35 degrees (25 to 70%) on unconsolidated materials and between 15 and 90 degrees (25% to vertical) on bedrock. Local relief is greater than one metre. Differentiated from rolling on the basis of slope angle. Possible locations include drumlinized till plains, eskers and ridged bedrock. These may be created through the erosional effects of water.

T Terrace(s)
Step-like topography where each step-like form consists of both a scarp face and a horizontal or gently inclined surface above it. The terrace description is applied to both the scarp and the flat surface.

U Undulating
Gently sloping hillock(s) and hollow(s) with slopes of up to 15 degrees (25%). Local relief is greater than one metre. Slopes are non-linear (not parallel), chaotic forms that are rounded or irregular in profile.

Input Format:	X
Input Example:	N
Data Origin:	input
Attribute Source:	vri

Sequence:	30
Optional:	Y
Format:	varchar2
Length:	1
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_poly

Notes: Together with the attributes "modifying processes" and "site position meso" will provide clues to soil parent material and useful site classification data.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: tree_cover_pattern

Alias: tree cover pattern

Forestry Term: Tree Cover Pattern

Description: A numeric code that identifies the spatial distribution of the tree layer in the polygon. Examples include treed islands in the sub-alpine parkland, clumps of trees on rocky outcrops, scattered groves or individual trees in an otherwise shrubby flood plain, or solid continuous tree cover. Tree cover pattern provides information on the amount of "edge" and "interior" habitat or growing conditions within the polygon. Tree cover pattern describes the spatial distribution of the tree cover within each tree layer in the polygon. Tree cover pattern is used to describe the tree layer spatial distribution.

Measurement Criteria: Cover pattern is estimated for each tree layer in the polygon.

Standard: Cover pattern is based on the majority area coverage.

Default:

Permitted Values:

1. Single to very few (<4) occurrences of limited extent, circular to irregular shape.
2. Single to very few (<4) occurrences of limited extent, linear or elongated shape.
3. Several (>3) sporadic occurrences of limited extent, circular to irregular shape.
4. Several (>3) sporadic occurrences of limited extent, linear or elongated shape.
5. Intimately intermixed units, often with gradational transitions from one to the other.
6. Discontinuous but extensive occurrences, parallel to sub-parallel elongated in shape.
7. Limited continuous occurrence with few inclusions.
8. Continuous occurrence with several inclusions.
9. Continuous occurrence with very few inclusions.

Notes:

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: vertical_complexity

Alias: vertical complexity

Forestry Term: Vertical Complexity

Description: The subjective classification that describes the form of each tree layer as indicated by the relative uniformity of the height of the forest canopy as it appears on mid-scale aerial photographs. Vertical complexity is influenced by stand age, species (succession as it relates to shade tolerance) and degree and age of past disturbances. The tree height range is calculated as the total difference in height between the tallest and shortest visible dominant, co-dominant, and high intermediate trees. To most adequately represent the tree layer of interest, occasional occurrences of either very tall or very short trees should be ignored so that the vertical complexity indicated is for the majority of stems in the dominant, co-dominant, and high-intermediate portion of each tree layer. Vertical complexity is a subjective classification that describes the form of each tree layer as indicated by the relative uniformity of the forest canopy as it appears on mid-scale aerial photographs.

Measurement Criteria: Vertical complexity is influenced by stand age, species (succession as it relates to shade tolerance) and deg

Standard: Calculate the percent difference in tree height for the assignment of the Tree Vertical Complexity code.

Default:

Permitted Values: Codes Description

1 Very uniform
A very uniform canopy with less than 11% difference between the height of the leading species and the average tree layer height. Holes (or canopy gaps) are generally not visible in the canopy and there is usually no evidence on the photograph of recent disturbances affecting the form of the stand. Examples include plantations and young, immature stands of shade intolerant species.

2 Uniform
A uniform canopy with 11% - 20% difference between the height of the leading species and the average tree layer height. A few holes (or canopy gaps) may be visible in the canopy and there is usually little or no evidence on the photograph of recent disturbance affecting the form of the stand.

3 Moderately uniform
A moderately uniform canopy with 21% - 30% difference between the height of the leading species and the average tree layer height. Some holes (or canopy gaps) may be visible in the canopy and there may be evidence of past disturbance affecting the form of the stand. Stocking may be somewhat patchy or irregular. Examples include older spruce-balsam stands.

4 Non-uniform
A relatively non-uniform canopy with 31% - 40% difference between the height of the leading species and the average tree layer height. Holes (or canopy gaps) are often visible in the canopy (due to past disturbance) and stocking is typically patchy or irregular.

5 Very non-uniform
A very non-uniform canopy with more than a 40% difference between the height of the leading species and the average tree layer height. Stocking is typically very patchy or irregular. Examples include disturbed dry belt Douglas-fir stands and decadent, coastal over-mature stands.

vertical_complexity

Vertical Complexity

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes: Vertical complexity is used to identify and describe even-age and uneven-aged stands for further analysis in forest stand management and wildlife habitat assessment.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_poly

Attribute Name: vif_ver_hist_id_1

Alias: vegetation inventory format version history id 1

Forestry Term: Vegetation Inventory Format Version History Identity 1

Description: A unique, generated identifier for a RI history record. History has been SKEYed as it may relate to either a Vegetation polygon OR to a Tree Layer within a Vegetation polygon. Given the either or nature of the record an skey is appropriate as the buiness key will have nulls from the Tree Layer primary key when the record is for the entire polygon.

Attribute Name: vol_per_ha_spp1_125

Alias: volume per hectare for leading species at 12.5 cm

Forestry Term: Leading Species Volume per Hectare at 12.5 cm

Description: This is the Net volume per hectare of the leading species determined by percent basal area of the tree layer at the 12.5 cm utilization level. Net volume per hectare is determined as gross volume less decay, waste, and breakage. Depending on the magnitude of the species' decay, waste and breakage, the net volume for the leading species may be lower than volume for other species in the stand. Net volumes are calculated for Rank 1 layers only, Typid 1 through 3.

Attribute Name: volume_adj_factor

Alias: volume adj factor

Forestry Term: Volume Adjustment Factor

Description: A volume multiplier that can be used to increase or decrease stand volumes.

Measurement Criteria:

Standard: 4 character numeric value where 0.00 represents no volume change.

Default:

Permitted Values:

Input Format: #.###

Input Example: 0.146

Data Origin: input

Attribute Source: fip

Sequence:	
Optional:	
Format:	number
Length:	4
Decimal Places:	2
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Used in Timber Supply Analyses to adjust stand volumes (e.g. volume reductions on young, immature stands that have low stocking levels).

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: vri_dead_stems_per_ha

Alias: vri dead stems per ha

Forestry Term: VRI Dead Stems per Hectare

Description: The number of standing dead trees visible to the photo interpreter in the dominant, codominant and high intermediate crown layer. Snag frequency is expressed as stem per hectare for each tree layer. The snag frequency provides a direct estimate of snags per hectare that can be used for wildlife and fire management. Note: Dominant trees have well-developed crowns that extend above the general level of the trees around them. Codominant trees have crowns forming the general level of trees around them. High intermediate trees have smaller crowns slightly below but extending into the general level of trees around them.

Measurement Criteria: The following is a suggested approach to estimating snag frequency:

Standard: Snag frequency is expressed as stems per hectare for each tree layer.

Default:

Permitted Values:

Input Format:	###
Input Example:	750
Data Origin:	input
Attribute Source:	both

Sequence:	35
Optional:	Y
Format:	number
Length:	4
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: veg_comp_layer

Notes: The snag frequency provides a direct estimate of snags per hectare that can be used for wildlife and fire management and provides information for danger tree assessment.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: vri_live_stems_per_ha

Alias: vri live stems per ha

Forestry Term: VRI Live Stems per Hectare

Description: The average number of living trees visible to the photo interpreter in the dominant, co-dominant and high intermediate crown positions in each tree layer in the polygon. It is expressed as stems per hectare. This attribute is also called stand density.

Measurement Criteria: Estimate the density of trees in the polygon for each tree layer to the nearest stem per hectare when practic

Standard: It is expressed as stems per hectare.

Default:

Permitted Values:

Input Format:	####
Input Example:	2252
Data Origin:	input
Attribute Source:	both

Sequence:	34
Optional:	Y
Format:	number
Length:	6
Decimal Places:	
Null:	Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Density provides a direct estimate of tree stems per hectare.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual

Sub Type: veg_comp_layer

Attribute Name: year_of_estab

Alias: year of estab

Forestry Term: Year of Establishment

Description: The year the tree began to grow; applied to a layer (FIP) or a tree species (Vegetative Cover).

Measurement Criteria:

Standard: 4 character numeric code holding calendar year of stand

Default: 0

Permitted Values:

Input Format: ####

Input Example: 1991

Data Origin: input

Attribute Source: both

Sequence:

Optional:

Format: date

Length:

Decimal Places:

Null: Y

Use:

Linkage:

Relationship:

Sub Type Links: vegrpt_polylayer veg_comp_layer

Notes: Known as the Year of Stand Establishment in the FIP file. Used together with Layer History information (History Records) to track Silvicultural activities within the layer.

Tips and Hints:

Reference: MSRM, Resource Information Branch, Vegetation Resources Inventory, Photo Interpretation Procedures Manual
